

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

This Instrument with a little variation may be made a Reflecting Microscope of Water, if instead of the Ring *G* there be only a small Arm with a hole in it to receive a drop of Water, and the Cylindrick Vessel *B* be either taken away or screwed on with its bottom upwards, so as to make an Object Plate, and this will be found more convenient for viewing the Textures of Opacious Object, than that described in N° 223 of the Transactions, which is more fit for Fluid and Transparent ones.

I have begun some Experiments towards a way of making a large Concave *Speculum* for Burning Glasses, and have proceeded so far, as to find Materials that will naturally receive their true Figure, though of many Feet in Diameter, but have not yet overcome the difficulties of giving them a good Polish.

VII. *Extract of two Letters, the one to Dr. William Gibbons, Fellow of the College of Physitians London : the other to Mr. Nicholas Staphorft, Operator in Chymistry at Apothecaries-Hall, from Mr. Edward Coles, giving an account of a Red Colour produced by mixture of a Sulphureous Spirit with a Volatile Alcali.*

In making several Chymical Experiments found a Sulphureous Spirit, which being mixt with a Volatile Alcali, such as Spirit of *Sal Armoniack*, or Urin, &c. gives it a red Colour in a moment, and does the same without any effervescence, tho' both the Liquors were clear

clear before, wherefore considering that this Experiment might be serviceable in the demonstrating of Sanguification: I humbly offer it to your more refined Judg-
ment, and am

—In the Box is a bottle of the Spirit, you may put two parts of the Spirit to one of Spirit of *Sal Armo-niack*, and shake the Glass or Bottle, and it will be red in a Moment, tho' the more the Glass is shaken the deeper or blacker red it will be. I suppose there is enough in the Glass for you to Experiment, and to shew to the Virtuosos— I made the Spirit by Distill-ing 2 or 3 Pound of *Benzoin* with a little sand in a Retort, *ad Siccitatem*, and put the Oil, Spirit, and Flow-
ers altogether into a Paper Filtre, and the Spirit which came firt thro' is that which I have sent.

The Experiment abovementioned was tried before the Royal Society, and succeeded as above related, but the Circumstances must be diligently attended, or else it will not succeed.

VIII. A Note Communicated by Mr. Hill, con-fir-ming the great Age of Henry Jenkins, men-tioned No 221. p. 265. of these Transactions.

IN the Kings Remembrancers Office in the Exchequer, is a record of a deposition in a cause by English Bill, between *Ant. Clark and Smirkson*, taken April 1665, at Kettering in Yorkshire, where *Henry Jenkins* of Ellerton upon Swale Labourer Aged 157 Years was produced and deposed as a Witness. Divers very ancient Witnesses swore him to be a very Old Man when they first knew him.
